

BH Maintenance

Recently I was given the opportunity to work with the new innovative "TechBoard" product at Macmasters Beach.

First to remove all the old, tired rotting hardwood jetty decking timber and replacing with the new "TechBoard"

Admittedly at first I really wasn't sure how the new "TechBoard" would respond to friction heat build from the circular saw blade. Like most plastic products you can almost guarantee it will melt and clog your blade or chip and crack out. Much to my amazement "TechBoard" came through with flying colours (I was pretty happy with that outcome!)

Working with the new "TechBoard" was dead easy and much less time consuming than with timber.

The board itself looks of great quality with a lot of thought gone into its innovation and appearance. The non-slip tread area has superior non-slip resistance, looks professional and gives that high end marina look.

The internal honeycomb structure gives "TechBoard" real integrity and reveals a great position at the top of the honeycomb apex for countersinking for your screw at the same time offering maximum hold down efficiency for the boards width. I chose to use a 16 gauge stainless steel bugle/batten screw 65mm long for the job.

End result was awesome in keeping with the high end jetty marina look. In total, the new "TechBoard" system comes highly recommended for this type of job!

Desirable Characteristics of the new "TechBoard"

- ❖ Reasonably lightweight.
- ❖ U V Stable.
- ❖ Straight
- ❖ Easy Cutting/No Clogging
- ❖ End Caps (if desired)
- ❖ DIY
- ❖ Range Of Colours.
